Job Description (750 character max):

Perform Reactor Engineer/Operator duties, which includes operating a reactor as a certified Reactor Operator

Help prepare and handle experiment packages which may involve crane operations.

Maintain and repair reactor systems and associated support equipment which may involve forklift operations

Support experiment plan development and execution at nuclear facilities, radiological facilities, and reactors

Work with engineers to develop, design, and install new systems components or modify existing components

Write or modify operating and maintenance procedures or work packages

Ensure that facility operations align with the framework of a strong nuclear safety culture and implement effective operational decision-making

Support the development, maintenance, and implementation of the facility safety basis documents

Perform causal analysis and develop corrective actions for identified deficiencies

Prepare and present technical reports and presentations for professional organizations and user groups
